

# Container Security Monitoring using Open Source

Madhu Akula, Appsecco

# About Me

- Automation Ninja at [Appsecco](#)
- Expert in Security, Containers, Cloud and DevOps
- Speaker & Trainer at Defcon, Blackhat USA, Appsec EU, DevSecCon, All Day DevOps, c0c0n, null, etc.
- Discovered security vulnerabilities in Google, Microsoft, Yahoo, Adobe, LinkedIn, Ebay, AT&T, Blackberry, Cisco and many more
- Co-author of [Security Automation with Ansible2](#)
- Follow me (or) tweet to me at [@madhuakula](#)
- Never Ending Learner!

# What we are going to learn

- Why do we need container security monitoring?
- Container security monitoring
- How to implement container security monitoring?
- Introducing Sysdig Falco
- Automated defence based on container security attacks - demo!
- Other use cases
- References and resources

# Importance of container security monitoring

A faint, semi-transparent background image of a person sitting at a desk, looking at a laptop screen. The person is wearing a light-colored shirt and dark trousers. The background is a light blue.

An application vulnerability Server-Side Request Forgery (SSRF) in one of the containers running in Kubernetes cluster allows attackers to access and gain control over the entire Shopify cluster and instances.

Read more about <https://hackerone.com/reports/341876>

# Importance of container security monitoring

By pushing malicious images to a Docker Hub registry and pulling it from the victim's system, hackers were able to mine 544.74 Monero, which at time was equal to approximately \$90,000

<https://kromtech.com/blog/security-center/cryptojacking-invades-cloud-how-modern-containerization-trend-is-exploited-by-attackers>

# Why use container security monitoring?

- It enables us to perform the practice of looking at security frequently and easily
- To make important decisions for troubleshooting, monitoring is the place to start
- Taking certain actions based on the monitoring alerts
- We can apply the feedback into the system to learn and make it better

# Container security monitoring

- Collecting logs from containers to a centralised location
- Analysing logs to identify suspicious activity over a period of time
- Triggering alerts based on the thresholds and pattern matches
- It allows us to take actions based on the alert
- Helps us to apply feedback into knowledge bases and existing systems to make it better

# How to do container security monitoring

- There are multiple tools and methods to perform container security monitoring:
  - a. Collection
  - b. Identification
  - c. Actionable output

# How to do container security monitoring

- Collection
  - Key thing is to collect the logs and events related to the containers and store them in a centralised place for analysis
- Identification
  - Creating attack patterns to identify attacks and alert them
- Actionable output
  - Triggering alerts based on the identified attack patterns
  - Human (or) playbook (or) defence system to take actions based on the alerts triggered

# Simple and quick way to look at logs

The simplest way to look the container events and logs is using built-in commands

- docker events
- docker logs
- kubectl logs

# docker events example

```
$ docker events

# What about security specific monitoring?

There are many open source tools available in the market we can use, based on our needs and use cases. Here are some of them:

- AppArmor, Seccomp, SELinux, etc.
- Auditd, go-audit
- Elastic Beats
- Sysdig Falco

# Why Sysdig Falco?

- Sysdig Falco is a behavioral activity monitor designed to detect anomalous activity in applications
- Falco lets us continuously monitor and detect anomalies in containers, applications, hosts, and network activity
- Rich ruleset and ability to filter events for taking action
- It supports Docker, Kubernetes, Mesos, etc.
- Part of CNCF Sandbox project
- <https://falco.org>

# Why Sysdig Falco?

- Sysdig Falco is an auditing and monitoring tool whereas AppArmor or Seccomp are enforcement tools
- Sysdig Falco runs in user space, using a kernel module to intercept system calls
- Installing Falco and integrating with external resources is simple compared to other tools

# DEMO - Introducing Sysdig Falco

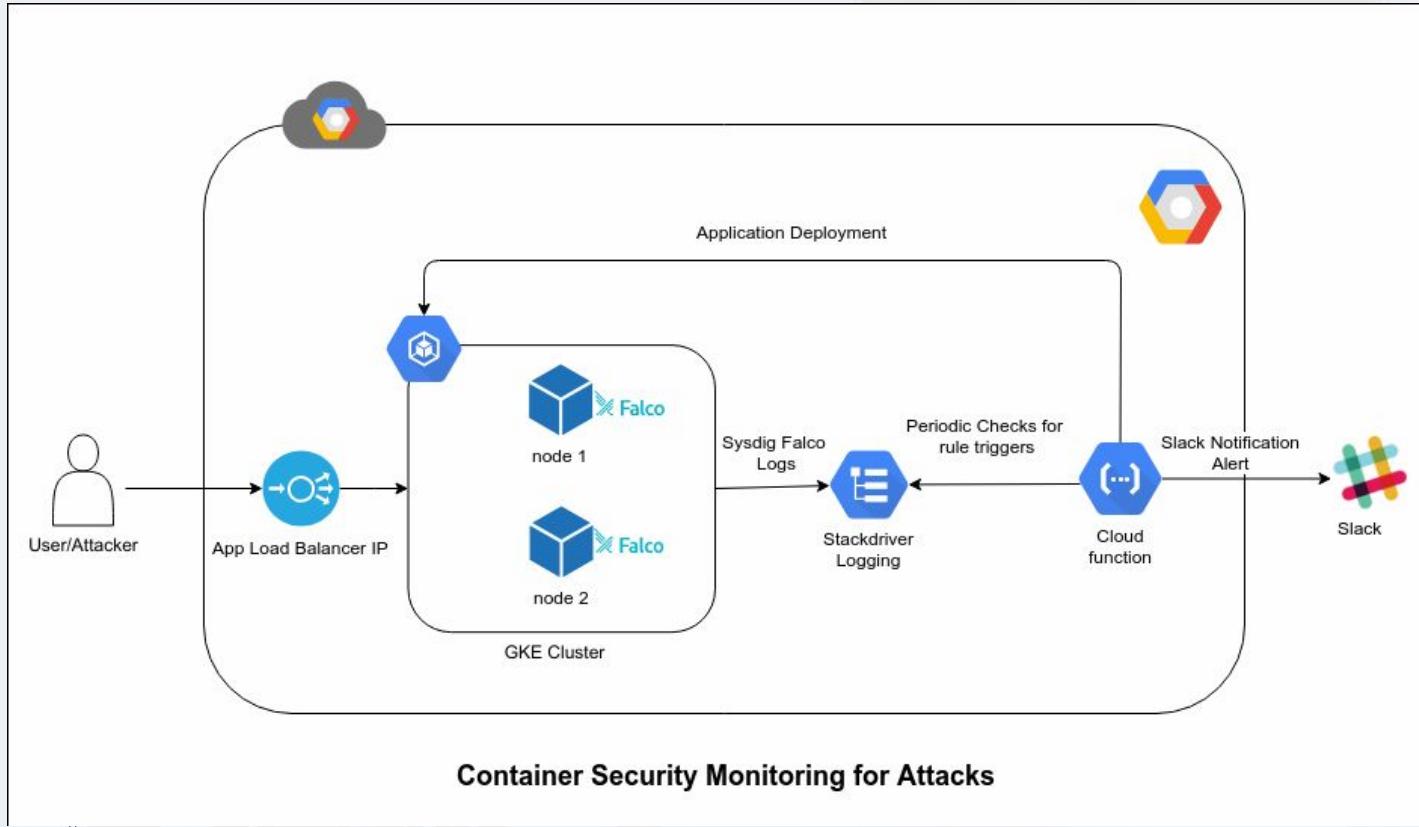

```
$ sudo falco
Mon Oct 15 00:49:07 2018: Falco initialized with configuration file /etc/falco/falco.yaml
Mon Oct 15 00:49:07 2018: Loading rules from file /etc/falco/falco_rules.yaml;
Mon Oct 15 00:49:08 2018: Loading rules from file /etc/falco/falco_rules.local.yaml;
00:49:32.084483398: Notice A shell was spawned in a container with an attached terminal (user=root nostalgic_goo

# Automated defense for container security

In this context, automated defence means applying defence against security attacks based on an attack pattern (or) an alert

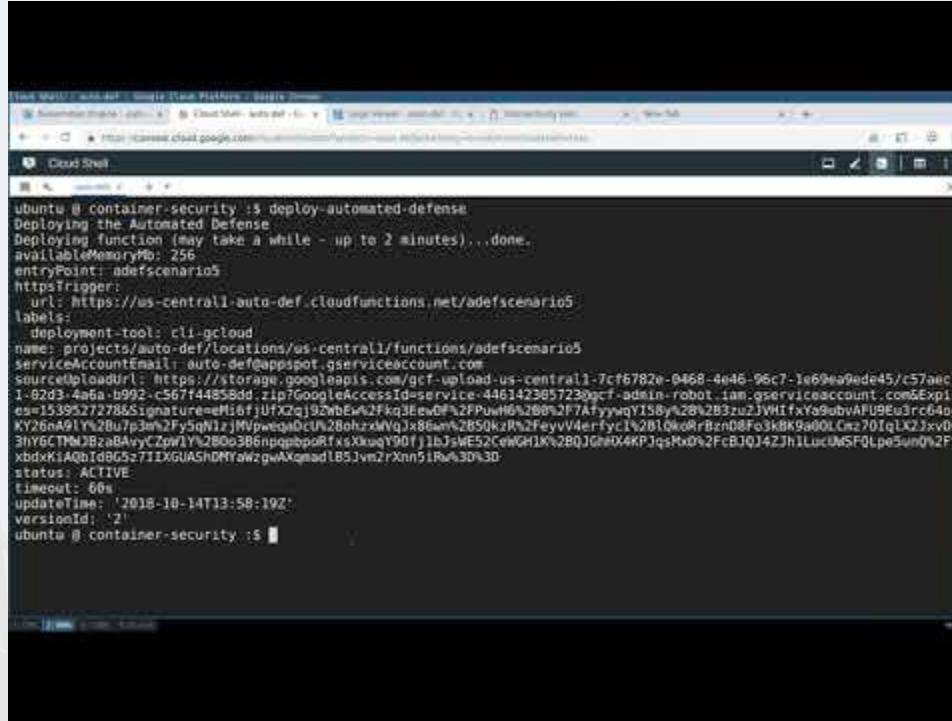

# Automated defense infrastructure setup

# Automated defense infrastructure setup

- We have 2 node Kubernetes cluster in the Google Cloud Platform
- Deploy the Sysdig Falco helm chart (installs as daemonset in the cluster)
- Deploy simple vulnerable web application
- Configure the Cloud Function to read GKE stackdriver logging and trigger alerts
- Slack channel for communication medium based on alerts
- Automated defence code for deploying the new releases with fixes based on attacks

# DEMO - Automated defense

```
ubuntu @ container-security:~$ gcloud functions deploy automated-defense
Deploying function (may take a while - up to 2 minutes)...done.

ubuntu @ container-security:~$
```

<https://youtu.be/zd0ksjZl5Vk>

# What just happened?

- We can see that an attacker performs a command injection attack to gain access to the system files
- The attack is identified and triggered as a slack alert
- After getting the alert we deploy the automated defence system
- Now the automated defense system will deploy a defence based on the alert and attack pattern
- If the attacker tries to perform the same attack, the attack fails because the fix is already in place

# Use cases

- Applying continuous security monitoring checks for deployments
- Building near real-time security defence for containerised environments
- Using automated defence with servicemesh using tools like Istio, Envoy, etc.

# Want to try it yourself in a browser?

## Welcome!

sysdig - Sysdig Falco: Container security monitoring

★ Difficulty: **medium**

⌚ Estimated Time: **20 minutes**

Sysdig Falco is an open source, behavioral monitoring software designed to detect anomalous activity. Sysdig Falco works as a intrusion detection system on any Linux host, although it is particularly useful when using Docker since it supports container-specific context like **container.id**, **container.image** or **namespaces** for its rules.

If you have not done it yet, it's a good idea to complete the [Sysdig Monitor](#) scenario before this one.

Sysdig Falco is an *auditing* tool as opposed to *enforcement* tools like [Seccomp](#) or [AppArmor](#). Falco runs in user space, using a kernel module to intercept system calls, while other similar tools perform system call filtering/monitoring at the kernel level. One of the benefits of a user space implementation is being able to integrate with external systems like Docker orchestration tools. [SELinux](#), [Seccomp](#), [Sysdig Falco](#), and you: A technical discussion discusses the similarities and differences of these related security tools.

In this lab you will learn the basics of Sysdig Falco and how to use it along with Docker to detect anomalous container behavior.

This scenario will cover the following security threats:

- Container running an interactive shell
- Unauthorized process
- Write to non user-data directory
- Sensitive mount by container

You will play both the attacker and defender (sysadmin) roles, verifying that the intrusion attempt has been detected by Sysdig Falco.

Based on Sysdig Blog articles <https://sysdig.com/blog/>.
